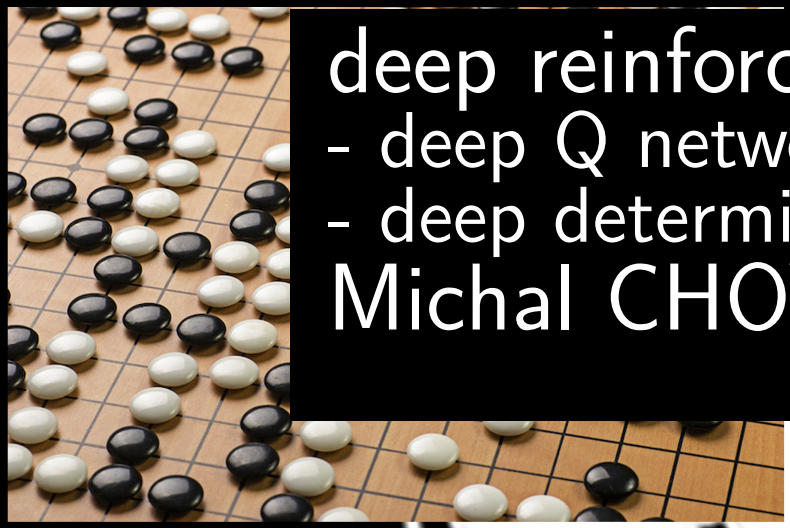
$$Q(s_t, a_t) \leftarrow Q(s_t, a_t) + \alpha\left[r_{t+1} + \lambda \max_a Q(s_{t+1}, a) - Q(s_t, a_t)\right]$$

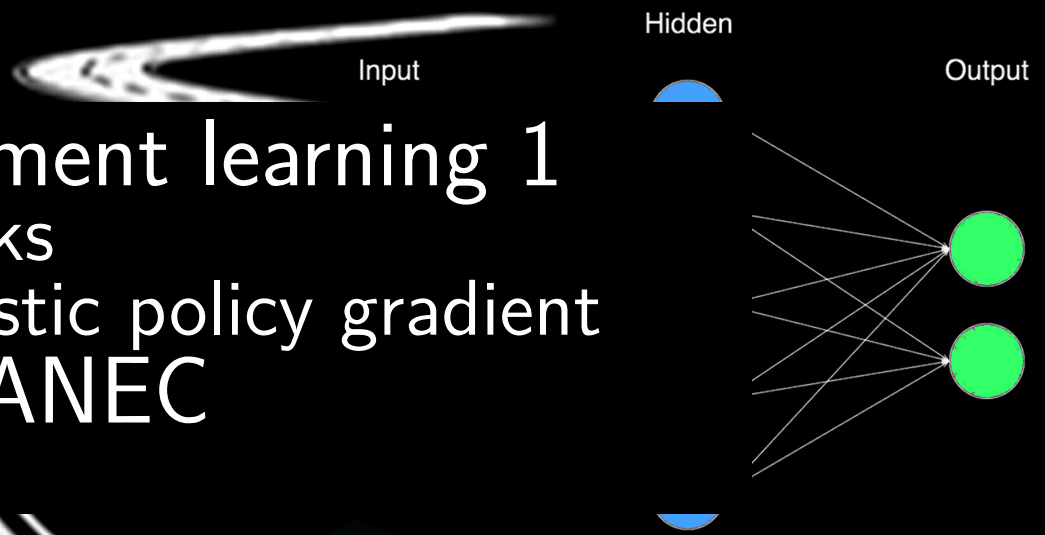
(The New Action Value = The Old Value) + The Learning Rate × (The New Information − the Old Information)

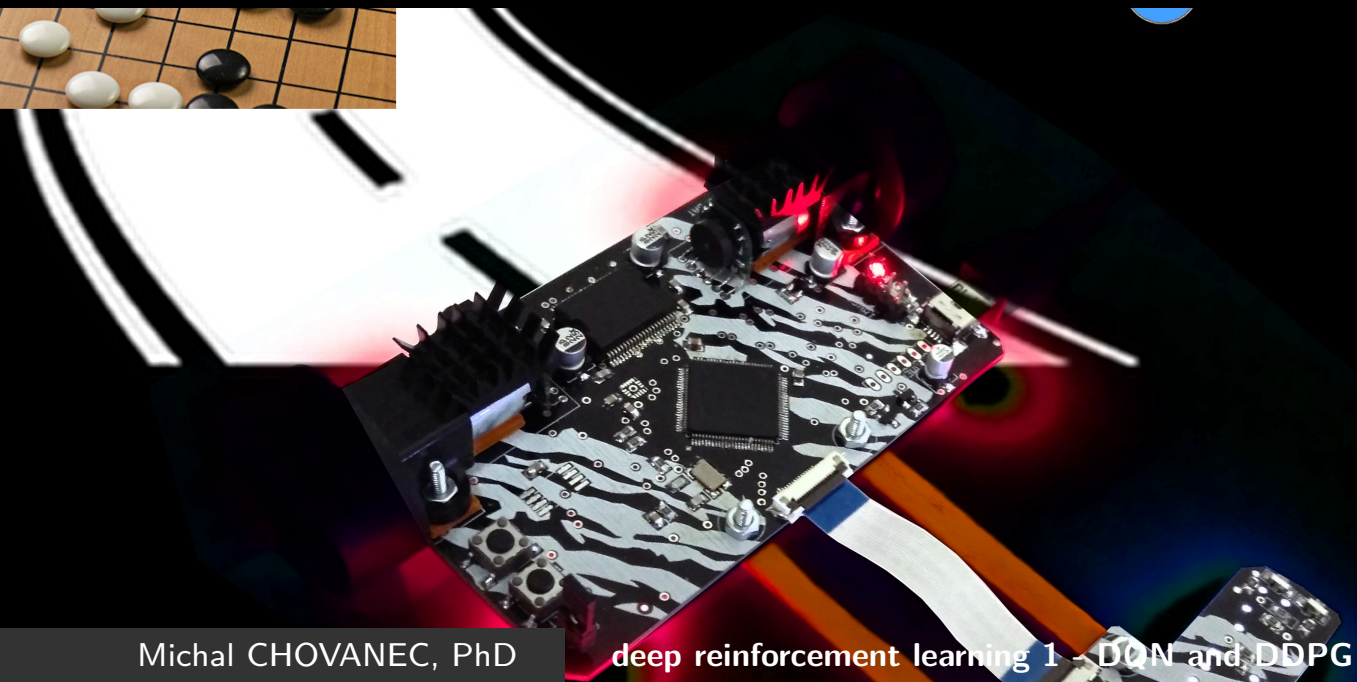


deep reinforcement learning 1

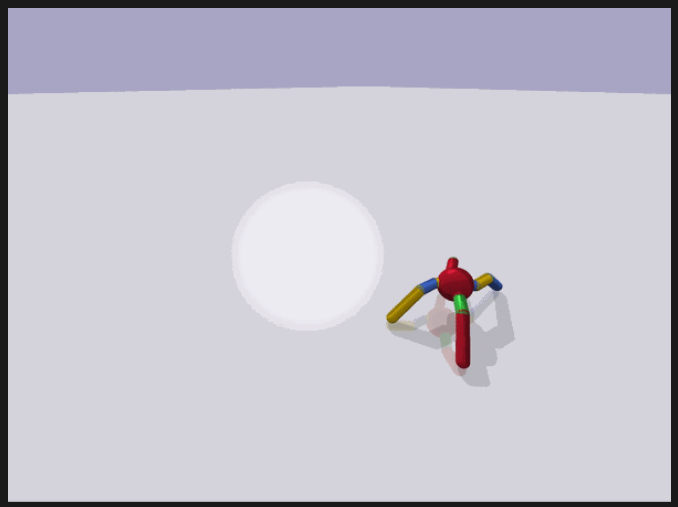
- deep Q networks
- deep deterministic policy gradient

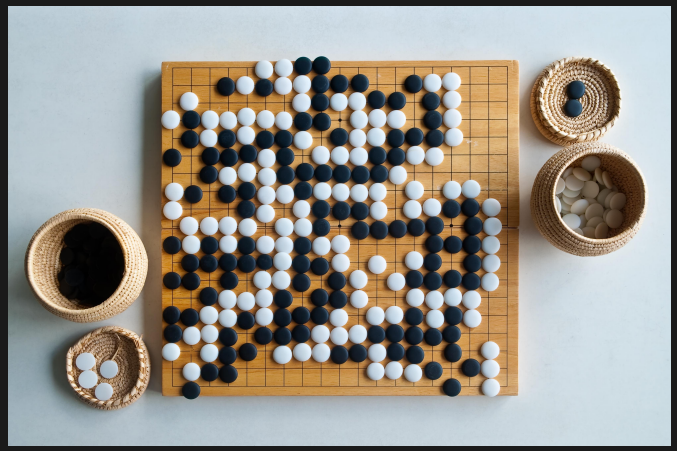
Michal CHOVANEC

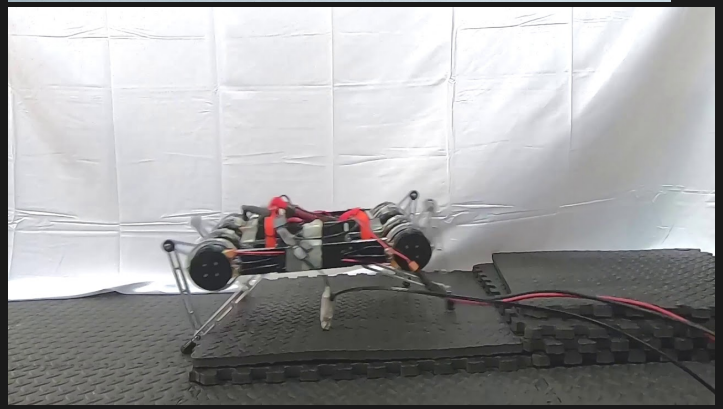




reinforcement learning

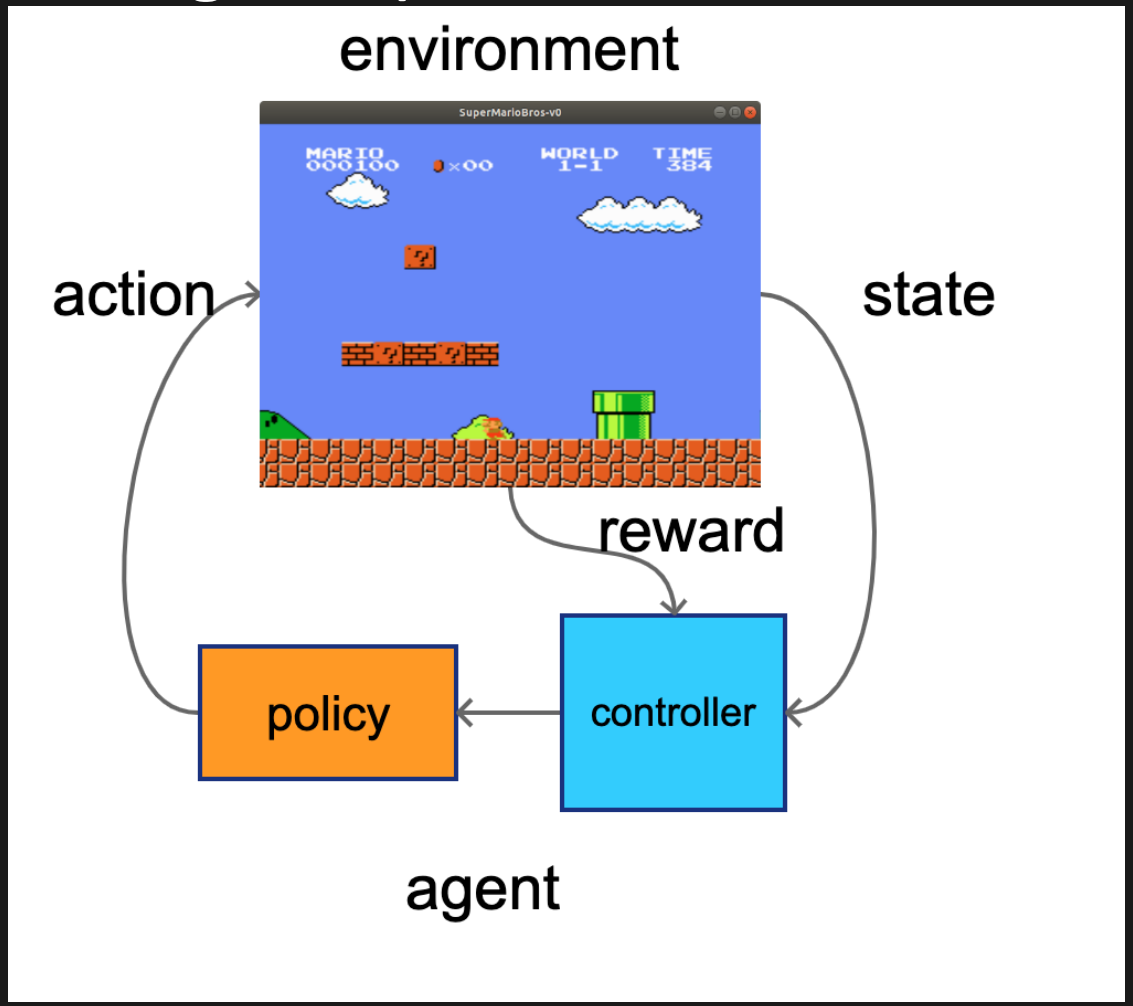




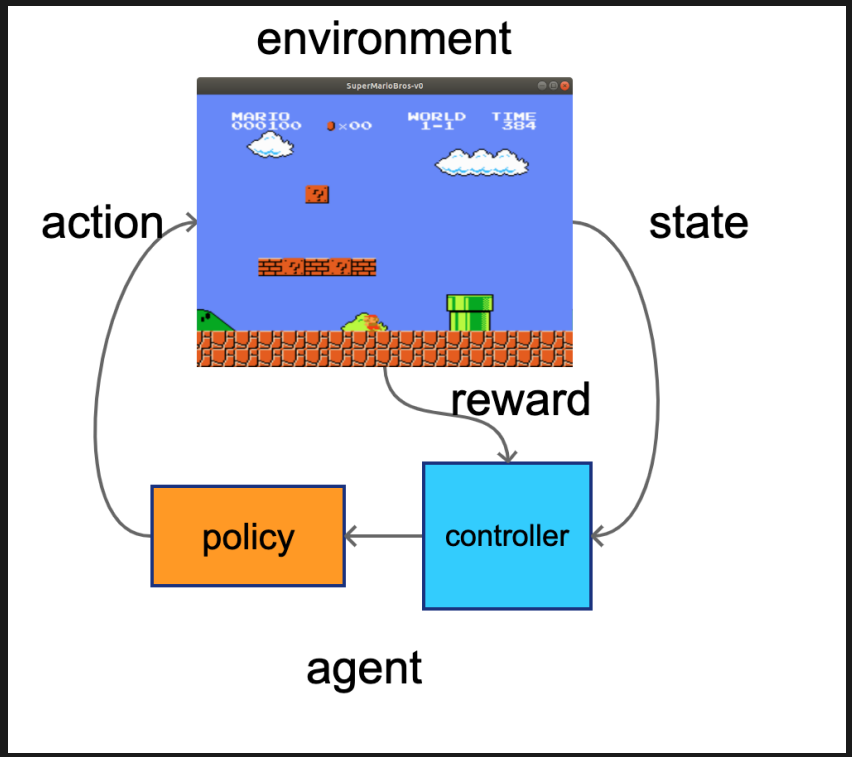


reinforcement learning

learning from punishments and rewards



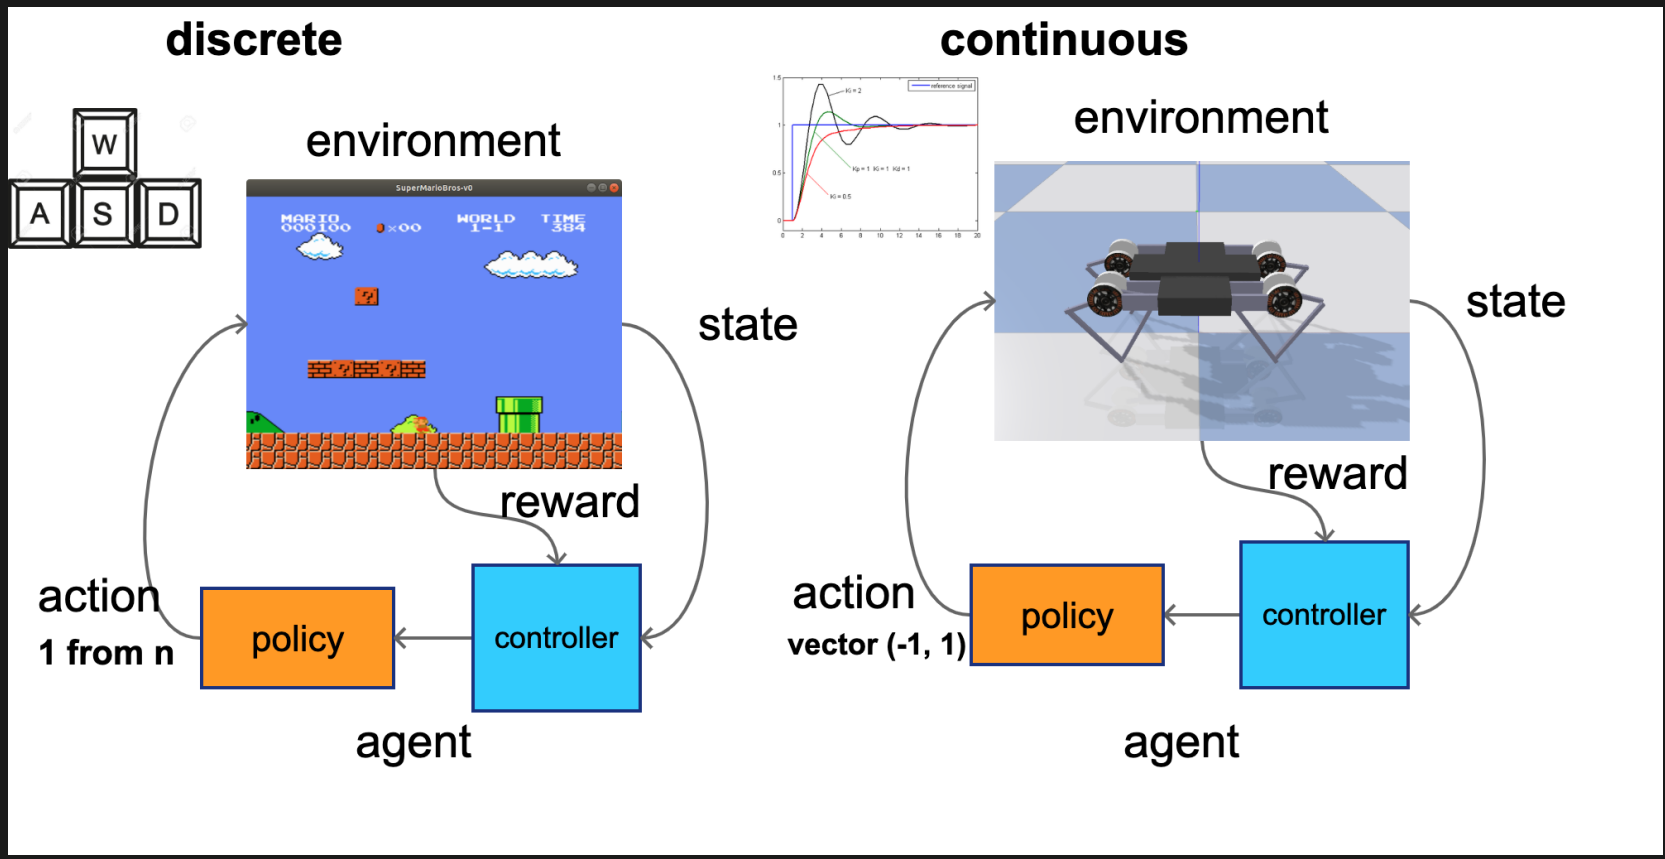
reinforcement learning



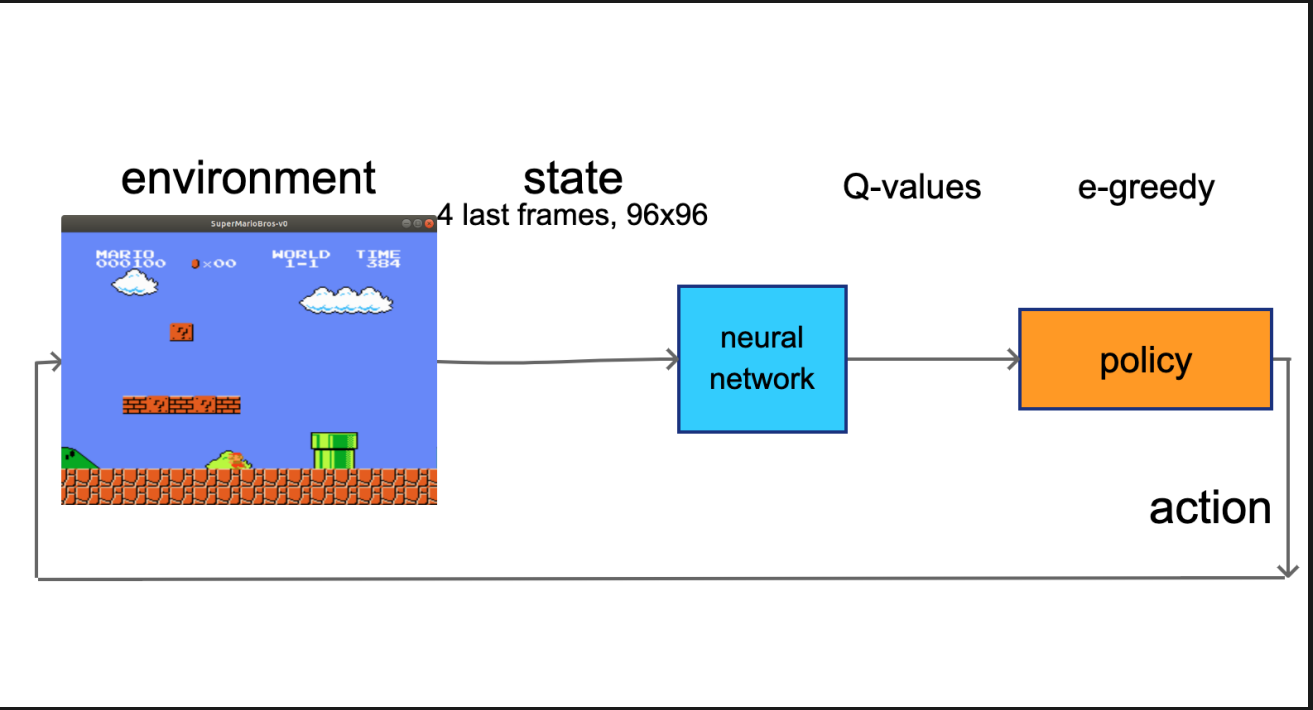
- obtain state
- select action
- exectute action
- learn from experiences

action space

- discrete action space
  - keys, keypad
- continuous action space
  - motors, PWMs, steering, force controll



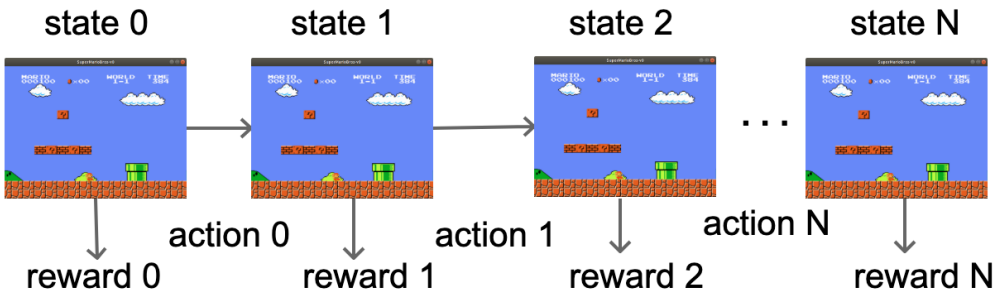
deep Q learning



1. play games
2. store transitions into buffer
   - state, action, reward, done
3. learn from buffer

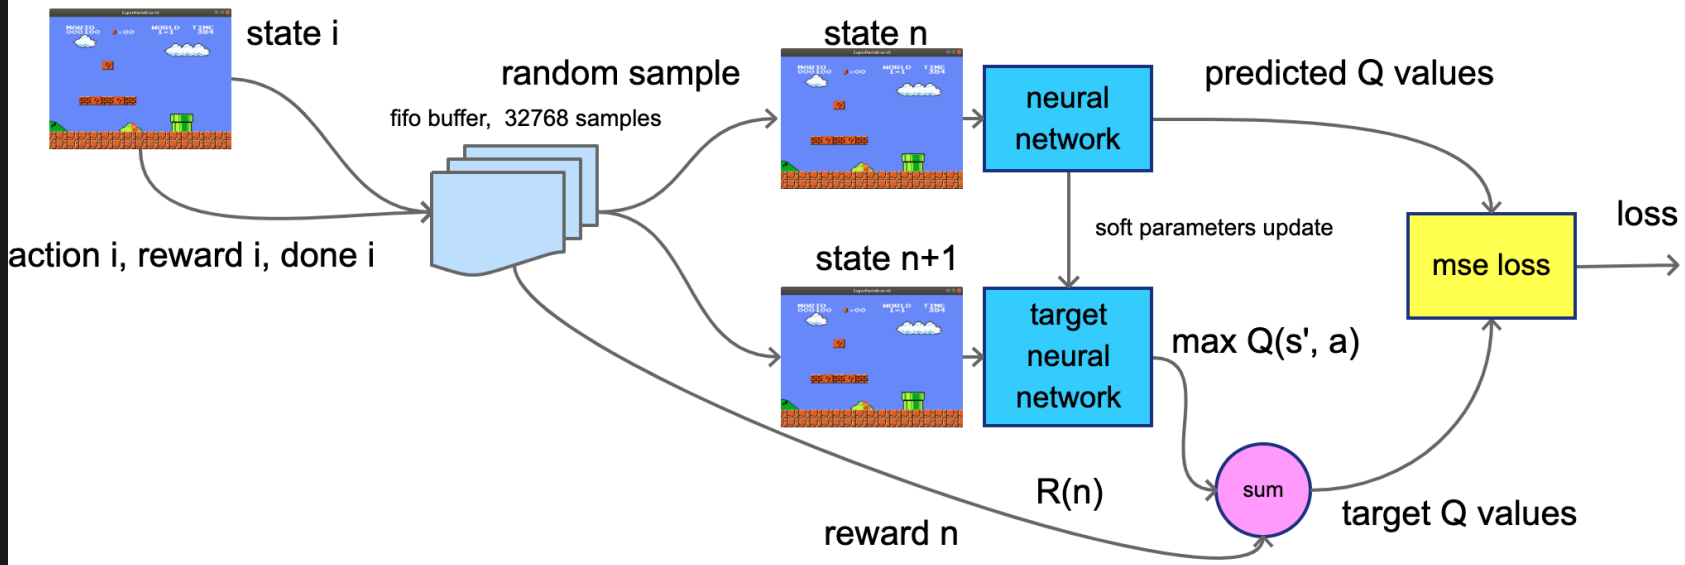
deep Q learning

1, game play

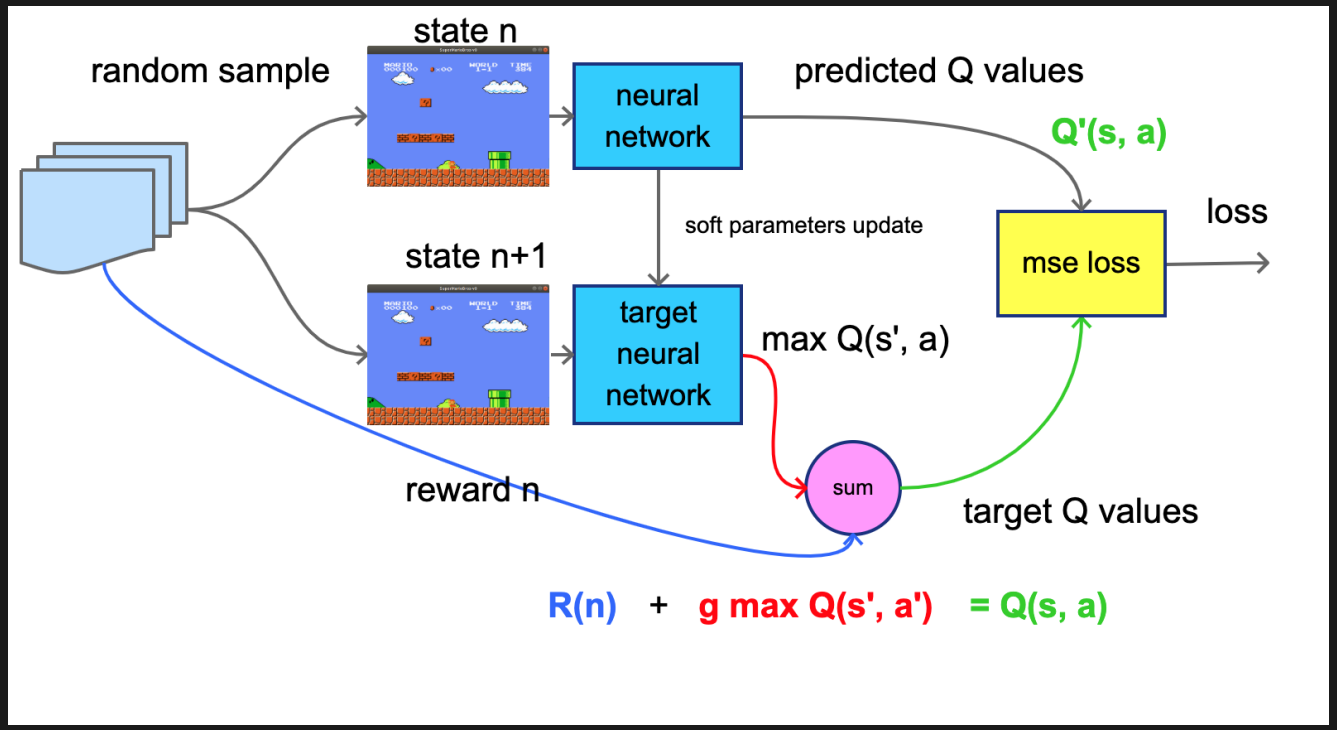


2, experience replay buffer

3, train network



deep Q learning

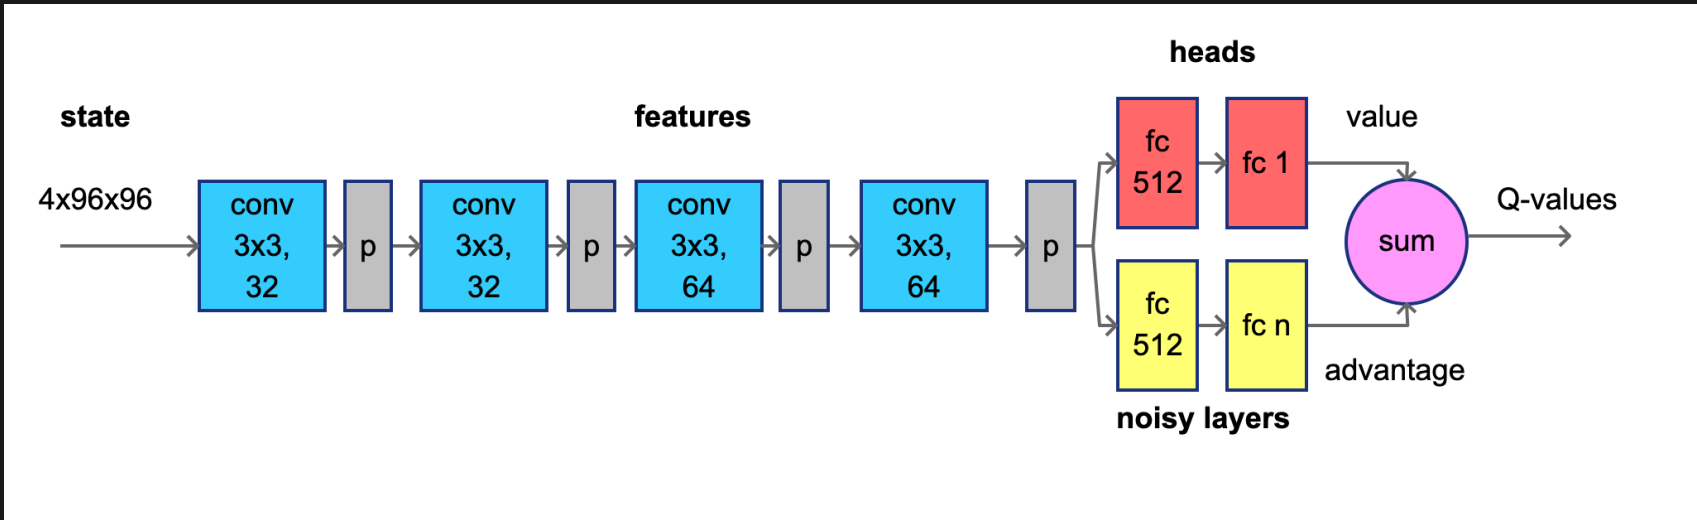


$$Q(s, a; \theta) = \underbrace{R}_{\textit{reward}} + \gamma \max_{a'} Q(s', a'; \theta^-)$$

discounted future reward

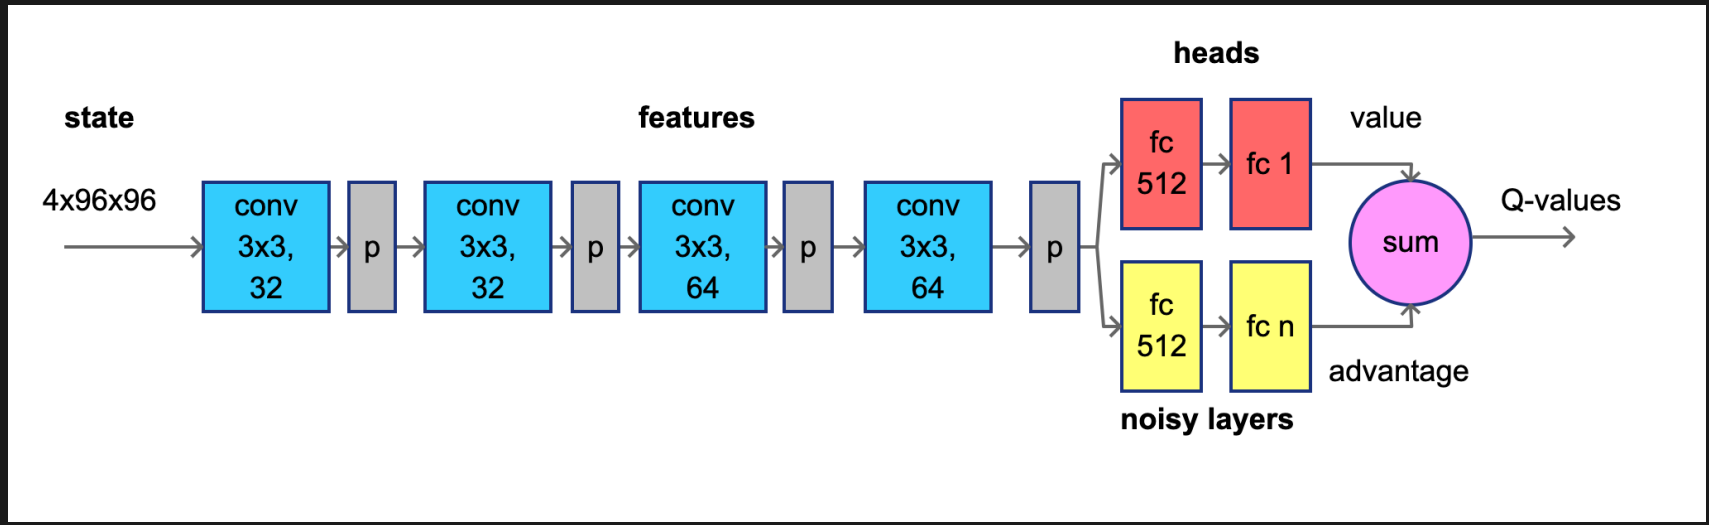
$$\mathcal{L}(\theta) = \left(R + \gamma \max_{a'} Q(s', a'; \theta^-) - Q(s, a; \theta) \right)^2$$

model architecture



- input 96x96 grayscale, 4 stacked frames
- 3x3 convs + pooling
- two fully connected layers
- small learning rate $\eta = 0.0001$, batch size $= 32$
- $\gamma = 0.99$
- exploration ϵ-greedy, 1M samples linear decay from 1 to 0.05
- total training 10M samples

dueling DQN, model architecture



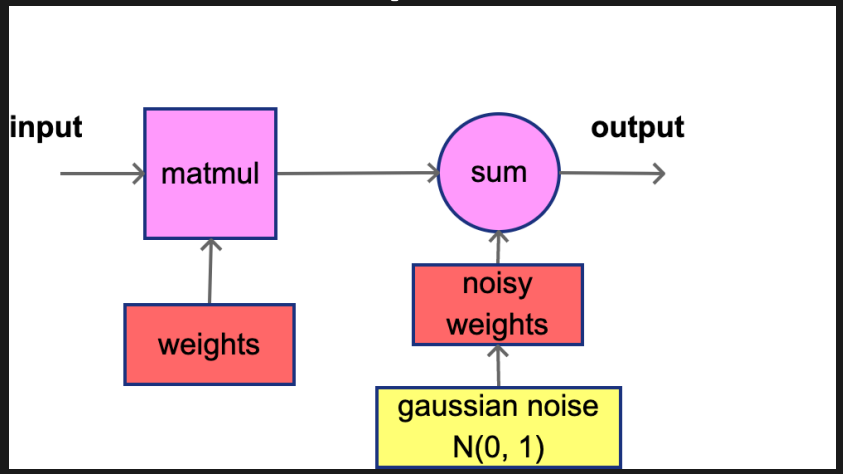
$$Q(s,a) = V(s) + A(s,a)$$

$$Q(s,a) = V(s) + A(s,a) - \frac{1}{|\mathcal{A}|} \sum_{a' \in \mathcal{A}} A(s,a')$$

```
WRONG   : q = value + advantage - advantage.mean()
CORRECT : a = value + advantage - advantage.mean(dim=1, keepdim=True)
```

noisy layers for exploration

action space noise



parameter space noise
