## 3, train network

# deep Q learning

$$Q(s, a; \theta) = \underset{\text{reward}}{R} + \gamma \max_{a'} Q(s', a'; \theta^-)$$

*discounted future reward*

$$\mathcal{L}(\theta) = \left( R + \gamma \max_{a'} Q(s', a'; \theta^-) - Q(s, a; \theta) \right)^2$$

# model architecture

- input 96x96 grayscale, 4 stacked frames
- 3x3 convs + pooling
- two fully connected layers
- small learning rate  $\eta = 0.0001$ , batch size = 32
- $\gamma = 0.99$
- exploration  $\epsilon$ -greedy, 1M samples linear decay from 1 to 0.05
- total training 10M samples

# dqn code

```
213     def train_model(self):
214         state_t, action_t, reward_t, state_next_t, done_t = self.experience_replay.sample(self.batch_size,
215
216         #q values, state now, state next
217         q_predicted      = self.model.forward(state_t)
218         q_predicted_next = self.model_target.forward(state_next_t)
219
220         #compute target, n-step Q-learning
221         q_target        = q_predicted.clone()
222         for j in range(self.batch_size):
223             action_idx          = action_t[j]
224             q_target[j][action_idx] = reward_t[j] + torch.max[q_predicted_next[j]*(1 - done_t[j])]
225
226
227         #train DQN model
228         loss = ((q_target.detach() - q_predicted)**2)
229         loss = loss.mean()
230
231         self.optimizer.zero_grad()
232         loss.backward()
233         for param in self.model.parameters():
234             param.grad.data.clamp_(-10.0, 10.0)
235         self.optimizer.step()
```

# dueling DQN, model architecture

$$Q(s, a) = V(s) + A(s, a)$$

$$Q(s, a) = V(s) + A(s, a) - \frac{1}{|\mathcal{A}|} \sum_{a' \in \mathcal{A}} A(s, a')$$

WRONG : `q = value + advantage - advantage.mean()`

CORRECT : `q = value + advantage - advantage.mean(dim=1, keepdim=True)`

# noisy layers for exploration

## action space noise

## parameter space noise

# results on MsPacman

# wise Wizard's DQN spell chart

- use **input** with nice size  $k2^j$ , 64, 96, 128 ...
- **conv layers** use 3x3 convs, poolings or strides  $> 1$
- for **weight init** use Xavier
- **don't use** batchnorm (use SkipInit - not tested yet),
- **don't use** weight regularisation
- use **soft** target network update,  $\tau = 0.001$
- slow learning rate  $\eta = 0.0001$  works better
- for exploration use  $\epsilon$ -greedy decay from 1.0 to 0.05 in 1M steps, or use noisy layers

## deep deterministic policy gradient

- continuous action space
- natural extension of DQN
- actor-critic structure

# DDPG

# DDPG

$$\mathcal{L}(\theta) = (R + \gamma Q(s', A(s'; \phi^-); \theta^-) - Q(s, A(s; \phi); \theta))^2$$

$$\mathcal{L}(\phi) = -Q(s, A(s; \phi); \theta)$$

where

- $Q$  is critic network with parameters  $\theta$
- $A$  is actor network with parameters  $\phi$
